1.000.000 reference numbers  
7.250.000 cross reference

## We recommend you to update every fortnight

Keep the programme always updated through the update module. In the miscellaneous menu (**F8**), on the Applications tab, you will find the option to initialise the update module.

In order to use the update module, you have to enter your user ID in the licence configuration screen.

The update module will allow you to download and install all the updates in one step (recommended option) through the **"Download and Install"** button or download the new items with the **"Download"** button, and later do the installation of the new data with the **"Install"** button.

news 2010-I

### Consultancy of information

### Monitoring of technical characteristics

### ElecFinderPlus

When someone is manipulating information, there is always the possibility of committing mistakes. All starters and alternator catalogues in paper or in electronic format, contain mistakes in the information.

In Factory Data we realize different processes of check and manipulation of information to try to minimize the existing mistakes in the information of the different suppliers.

Factory Data has advanced processes of analysis of information to analyze and to process the information correctly.

One of the areas of work that we have in Factory Data and that we put at the disposal of our customers, is the consultancy of information. These are some of the services of consultancy of information that we can offer you:

- Creation of new reference numbers codifications
- Generation of crossings and references among different manufacturers
- Validation and/or completion of information
- Selection of products for different categories
- Diverse studies

Contact with us and request budget for any type of study or consultancy that you need.

Thousands of references exist and equivalences between machines. When we try to locate a machine from the equivalences that the different suppliers facilitate to us, small problems of incompatibility can exist among these.

To try to help the user of the Elecsys program to select correctly the machine that you need, we have implanted a new system of detection of incompatibilities automatically on equivalences machines screen. The program analyzes the technical characteristics of the machine that is comparing and identifying the possible incompatibilities that exist among them.

In this version of the program it is analyzed dynamically the compatibility of the following technical characteristics:

- Voltage - Starter motors and alternators
- Power (Kw) – Starter motors
- Amperage - Alternators
- Number of teeth – Starter motors
- Rotation - Alternators

In a future we will analyze:

- Fixing – Starter motors and alternators
- Plug- Alternators

We hope that the program helps you in your daily work in a more efficient and professional form.

Nowadays there are more than 1000 manufacturers/distributors and hundreds of small domestic manufacturers/distributors with their own reference number system.

Every year there are hundreds of new superseded reference numbers, new reference numbers from main manufacturers, new crossings with OEM numbers, etc.

Reference numbers can be typed on many different ways: with or without zeros, with or without prefix and/or suffix, different format, etc.

#### Can you handle all this complexity by yourself?

**Do you want to loose hundreds of sales just because you don't know that you have the solution at home or because user doesn't write down reference number exactly like you expected?**

**elecfinderplus** is a sophisticated and powerful tool, which brings you the best solution in order to try to loose as less as possible sales just because your web search engine doesn't find out reference number when on the other hand you have the solution in your own catalogue.

**elecfinderplus** can be easily customized according to your needs and matching all your professional criterias.
